Ci- CARLLYTIC ACTIVITY: Degrades starch to cyclodextrins by of a 1,4-alpha-D-glucosidic bond.
Ci- COPACTOR: Binds 2 calcium ions per subunit.
Ci- SUBUNIT: Monomer.
Ci- SUBUNIT: May consist of two protein domains: the one in terminal side cleaves the alpha-1,4-glucosidic bond in terminal side cleaves the alpha-1,4-glucosidic bond in the other in the C-terminal side catalyzes other activiticaliding the reconstitution of an alpha-1,4-glucosidic for cyclizing the maltooligosaccharide produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDGU BACCI STANDARD; PRT; 71:

MALTOOLIGOSACCHARIDE PRODUCED.
                                                                                                                                                                                                                                                                                                                                                    A, from Bacillus licheniformis.";
leic Acids Res. 18:199-199(1990).
CATALYTIC ACTIVITY: Degrades Earch to
of a 1,4-alpha-D-glucosidic bond.
COFACTOR: Binds 2 calcium ions per subu
SUBUNIT: Monomer.
                                                                                                                                                                                                      SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QAWTKFDFPGRGNTYSSFKWRWYHFDGVDWDESRKLSRIYKFRGIGKAWDWEVDTENGNY

"Nucleotide sequence of the alpha-amylase gene from Vigna mungo.";
Plant Physiol. 103:1499-1495 (1993).
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
linkages in oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 3 calcium ions per subunit (By similarity).
-!- SUBUNIT: Monomer (By similarity).
-!- SUBUNIT: Monomer (By similarity) 13 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.                                                                                                       Svendsen
                                                                                                      Þ
                                                                                                      Thellersen
```

AAG65881

Variant alpha amylase enzymes which have improved washing and/or as detergent additives. The enzymes have one or more amino acid residues added, deleted or substituted. The variants can also be used for textile desizing prior to scouring, bleaching and dyeing. The variants have improved thermostability, acid/alkaline stability; low temperature optimum; pH optimum; higher hydrolysis velocity and improved tolerance to other composition constituents, e.g. oxidation agents. (Updated on 25-MAR-2003 to correct PN field.)

Claim 6; Page 72; 105pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oxidation stable alpha amylases can be used for the simultaneous desizing and bleaching or scouring of a fabric comprising starch or starch derivatives. They exhibit a better heat stability, especially in the presence of oxidising agents. They are obtained from a parent alpha amylase by replacing one or more methionine residues with any amino acid different from Cys or Met, preferably Leu, Thr, Ala, Gly, Ser, Ile or Asp. The parent alpha amylase is derived from a Bacillus species. This is the wild type (unmodified) alpha amylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 6; Page 22; 37pp; English.

CC from: substrate specifically, binding or cleavage pattern; thermal considering considerion; C22 dependency and specific; stability towards concernation; C22 dependency and specific activity. The variant has one or CC entropy and specific activity. The variant has one or CC (bulkier amino acid) including 1201W, F, L; Y2030, 09K, L, E; F118, K, E; CC H105R, K, D, E, W, Y233D, K234I, E; T136R, K, D, E, F, Y102R, K, D, E; Y2030, 09K, L, E; F118, K, E; CC H105R, K, D, E, W, Y233D, K234I, E; T136R, K, M, D, E; L230H, K, I; CC H202; D100N, L; V101H, R, K, D, E, F1731B, K, E; CC H, D, E; V283H, D; F284H; D25R, K, D, E, F273R, K, D, E; L270R, K, CC H, D, E; V283H, D; F284H; D25R, K, D, E, K25K, R, D, B; L270R, K, CC H, D, E; V283H, D; F284H; D25R, K, M, T, L, D, E; V290R, E, K; CC H, D, E; V283H, D; F284H; D25R, K, M, T, D, D; X290R, E, K; CC H312R, K, D, E; F333H; D325R, M326K, H, D, E; L230R, K, M, E, D; E; V293R, E, K; T33BD, E; T33BD, E; T33BD, E; T33BD, E; T33BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD, E; T38BD,

The variants are produced by creating one or more of the following mutations in amino acid sequence of the parent termamyl-like alpha-amylase: T141, K142, F143, D144, F145, P146, G147, R148, G109, D174, R181, G182, D183, G184, K185, A186, W189, S193, N195, H107, K108, G109, D166, W167, D168, D169, S170, R171, D172, F173, F267, W268, K269, N270, D271, L272, G273, A274, L275, X311, E346, K385, G456, W458, K488, P459, G460, T461, V462, T463. The variants can be used for washing and/or dishwashing. They can also be used in the production of sweeteners and ethanol from starch, and/or for textile desizing, and in starch liquefaction and/or saccharification processes. The present amylase can function as the parent sequence in the production of the variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

The glucose syrup obtained by the process is useful as an ingredient in food products. The Termamyl-like alpha-amylase facilitates the preparation of glucose syrups suitable for the food industry, previously only possible using acid hydrolysis. The present sequence represents Bacillus licheniformis Termamyl-like alpha-amylase

The variants comprise mutations in 2-6 regions/positions relative to an alpha-amylase from either of two Bacillus species in WO9526397, B. stearothermophilus, B. licheniformis, B. amyloliquefaciens or Bacillus sp. #707. The alpha-amylase variants are detergent additives for use in detergents for dishwashing, manual or automatic laundry. The variants can also be used for textile desizing or starch liquefaction (e.g. for production of

```

Ś

The present sequence is a parent alpha-amylase from which mutants with increased stability at acidic pH, low calcium concentration and high temperatures have been derived. The enzyme is commercially available as Termamyl. A variant may contain mutations in one or more solvent exposed amino acid residues to increase the overall hydrophobicity of the enzyme or the overall number of methyl groups in the side chains of exposed residues may be increased. The mutations can be incorporated by sitedirected mutagenesis or by random mutagenesis. As a result of their increased stability, the variants are suitable for the industrial

Variant of parent termamyl-like alpha amylase useful for washing, tdesizing and starch liquefaction, comprising alterations in one or solvent exposed amino acid residues.

CC This sequence represents a termamyl-like alpha amylase. The invention CC relates to a variant (I) of parent Termamyl-like alpha-amylase comprising CC alteration at one or more of the positions W13, G48, T49, S50, Q51, A52, CC D53, V54, G57, G108, A111, S168 and M197. The alterations in (I) CC are independently an insertion of an amino acid downstream of the amino CC acid which occupies the position or deletion or substitution of the amino CC acid which occupies the position with a different amino acid. The variant CC has alpha-amylase activity. (I) or compositions containing it are useful in starch liquefaction, in detergent compositions such as laundry, dish CC washing and hard surface cleaning compositions, ethanol production such as fuel, drinking and industrial ethanol production, desizing of creating a fabrics or garments. (I) exhibits a reduced capability of CC cleaving a substrate specificity and/or improved specific activity relative to the parent alpha-amylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Andersen (

                                                                                                                                                                                                                                                        The present invention describes a variant of a parent termamyl-like alpha -amylase (EC 3.2.1.1) (I) comprising an alteration at one or more positions of a group of 31 possible amino acid positions. The alteration in (I) may be at Arg28, Arg118, Asn174, Arg189, Gly182, Asg183, Gly184, Asn195, Met.202, Tyr298, Asn299, Lys302, Ser303, Asn306, Arg310, Asn314, Arg320, His324, Glu345, Tyr296, Arg400, Trp439, Arg444, Asn445, Lys466, Gln449, Arg458, Asn471, or Asn484. (I) can be used for washing and/or dishwashing, textile desizing, and starch liquefaction. (I) is useful as a component in hard surface cleaning detergent composition, and for producing sweeteners and ethanol from starch. (I) has altered solubility, preferably increased solubility, in particular under washing, dish washing or hard surface cleaning conditions. The present sequence represents a Bacillus licheniformis termamyl-like alphamylase which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          08-MAR-2000;

X The invention relates to a variant of parent TERMAMYL-like alpha-amylase comprising an alteration at regions 186-193, 261-276, 283-293 or 334-339, or at position 234, where the variant has alpha-amylase activity and each position corresponds to a position of a parent Termamyl-like alpha-amylase sequence having a Bacillus licheniformis alpha-amylase sequence of 483 amino acids, given in specification. The variant alpha-amylase, a detergent additive comprising the variant or a detergent composition comprising the variant, is useful for washing and/or dishwashing or textile desizing. The alpha-amylase is useful for starch liquefaction or ethanol production and as a component in a hard surface cleaning

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detergent composition, and for producing sweeteners from starch. The variant has altered alpha-1, 6-D-glucosidic branch linkage cleavage activity on amylopectin, preferably increased alpha-1, 6-D-glucosidic branch linkage cleavage activity of amylopectin or a limit dextrin prepared by TERMANYL (RTM) or NOVAMYL (RTM). The present sequence is the TERMANYL alpha-amylase upon which the variants of the invention are based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to KSM-K36 or KSM-K38 variant of parent alpha-amylases (alpha-1,4-glucan-4-glucanohydrolases, EC 3.2.1.1) from Bacillus. The variants have alpha-amylase activity and exhibit an amino sold alteration such as an insertion, deletion or substitution of the parent alpha-amylase. The variants are useful for washing and/or dishwashing, textile desizing, starch liquefaction and alcohol production, washing textile desizing, starch liquefaction and alcohol production, particularly ethanol production. They are also useful as components in detergents for e.g. laundry, dishwashing and hard surface cleaning detergent compositions, in pulp and paper production, in beer making or brewing and in production of sweeteners. The present sequence is Bacillus licheniformis alpha-amylase protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      \kappa_{SM}-\kappa_{36} or \kappa_{SM}-\kappa_{38} variant from Bacillus for cleaning dishes, textile desizing, starch liquefaction and ethanol production has alpha-amylase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAB47850-56 show modified alpha-amylases derived from the genus Bacillus. These alpha amylases are Termamyl- like alpha-amylase and they have been pre-oxidized. The alpha amylase is useful for producing a maltodextrin or glucose syrup, by treating starch with a pre-oxidized alpha-amylase until a product with a DE between 5-45 has been provided and/or until a product with a molecular weight of between 5-30 kda has been provided. The product comprises a maltodextrin with a DE of 18.5 and/or a maltodextrin with a molecular weight of 14-16 kda. The alpha amylase is useful for producting a maltodextrin or glucose syrup, there the glucose syrup is useful in confectionery such as candies, beverages such as isotonic drinks, bakery such as cereal bars, candies, beverages such as isotonic drinks, bakery such as cereal bars, salad dressings, and food ingredients and preparations such as cured meat, fermented meat, spices and seasoning encapsulated flavours

                                                                                                                                                                                                                                                                  Variant of parent Termamyl-like alpha amylase, useful in detergent compositions, for starch liquefaction, ethanol production, washing dish washing, and textile desizing.
                                                                      This invention relates to variants of a parent Termanyl-like amylases. These are used for starch liquefaction, ethanol prodetergent, and textile desizing. The amylases have altered sparticularly at high temperatures from 70-120plusoC and low range from pH 4.0-6.0. The present sequence is a termamyl-li
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bacillus licheniformis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Termamyl; alpha amylase; sta:

A polypeptide (AAR98007) is composed of Termamyl alpha-amylase, a linker derived from the IgG3 hinge domain and a leucine zipper from the GCN4 yeast transcription factor. It was produced by PCR amplification of the Termamyl gene and ligation of synthetic oligonucleotides (see also AAT33229-32) encoding the leucine zipper and linker. Upon expression in E.coli, using a vector including the pelB signal sequence, the Termamyl product self-oligomerised into a dimer that was secreted into the periplasm. The method constitutes an industrially applicable process for producing a biologically active polypeptide that self-oligomerises owing to the presence of leucine zippers, the enlarged size of the resulting polypeptide leading to a reduction in its allergenicity. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  odn. of self-oligomerising peptide(s) with reduced allergenicity - household and personal cleaning prods., and in food and feeds etc.

Peptide
                                                                                                                                                                                                                     This protein sequence comprises a hybrid enzyme in which Bacillus licheniformis alpha-amylase (Termamyl) signal peptide is linked to the cellulose binding domain (CBD) of cellulomonas fimi CenA, which is further linked to mature Termamyl polypeptide. The CDB-Termamyl fusion has been expressed and secreted as an approx. 85 kDa protein in Bacillus subtilis PL2306 transformants. A claimed process for desizing cellulose-containing fabric or textile comprises treating the fabric or textile with a modified enzyme (enzyme hybrid) comprising a non-cellulolytic enzyme linked to a CBD. The process gives improved enzyme performance by modifying the enzyme so as to increase its affinity for cellulosic fabric. A desizing composition suitable for use in the process comprises the enzyme hybrid and a wetting agent. (Updated on 17-OCT-2003 to
